San Francisco, CA 94102

**Re: California Community Choice Association's Protest to Southern California Edison Company's Tier 2 Advice Letter 4570-E -- Tier 2 Advice Letter Justifying Southern California Edison Company's Methodology for Determining PCIA-Eligible Resource Adequacy Reserved for its Bundled Portfolio Plan**

Dear Mr. Randolph:

Pursuant to the California Public Utilities Commission's (Commission) General Order (GO) 96-B,<sup>1</sup> the California Community Choice Association<sup>2</sup> (CalCCA) submits this protest of Southern California Edison Company's (SCE) Advice Letter 4570-E (Advice Letter). SCE submitted the Advice Letter on August 23, 2021 to provide its methodology for determining how much of its Power Charge Indifference Adjustment (PCIA)-eligible resource adequacy (RA) capacity is reserved as part of its Bundled Portfolio Plan (BPP), as required by Decision (D.) 21-05-030.

For the reasons set forth below, the Commission should require SCE to provide greater justification by demonstrating the risks it describes in its Advice Letter based upon historical experience of those risks being realized. The Commission should also place more meaningful limits, including a firm monthly cap on the amount of capacity retention, so that all LSEs can meet their compliance obligations and the resources are made available through a CAISO must offer obligation.

---

## PROTEST

### 1. **SCE's Methodology For Its Reservation of RA Capacity Is Not Sufficiently Justified**

D.21-05-030 requires each investor-owned utility (IOU) to file an advice letter to justify its methodology for determining how much of its PCIA-eligible RA is reserved as part of the IOU's BPP. This approach is appropriately tailored to address the transparency concerns raised by Working Group 3 (WG3) co-chairs while minimizing the risk of unintended consequences.<sup>3</sup>

In the Advice Letter, SCE fails to provide meaningful insight into its methodology for determining how much excess RA capacity SCE will retain for its own use instead of offering the RA to the market. Rather, SCE refers to circumstances that would place a desire for SCE to do so that primarily hinge on uncertainty, compliance, or financial risk. However, a simple listing of potential reasons to retain capacity from a very constrained market is insufficient justification.

CalCCA does appreciate that SCE offered a range for its buffer based upon its experience with the risk that SCE attempts to mitigate. While SCE does suggest their "buffer" is generally no more than 2% of summer peak loads,<sup>4</sup> given the load presently served by SCE, this could easily amount in up to 400 megawatts (MWs) of capacity that could be retained that could have otherwise been provided to the market. An approach of capping the retained RA could be reasonable but should be based upon the monthly need and not the entire annual peak. In addition, there should be a more complete showing demonstrating why 2% is a reasonable number considering the large quantity that even such a small percentage creates.

In July 2021 (a high load month), the IOUs collectively retained 619 MWs of RA capacity. This is sufficient to serve a load of 538 MWs with the required 115 percent Planning Reserve Margin (PRM). In August, that total retained capacity was 157 MWs which would serve a 136 MW load with the required 115 percent.<sup>5</sup> These are not insignificant amounts that could have served significant amounts of load for smaller load-serving entities (LSEs). Instead, those LSEs themselves faced the uncertainty, compliance, and financial risks that the IOU seeks to avoid. Retaining capacity of this magnitude accordingly deserves more justification than a simple listing of elements that may cause the need to retain.

In addition, the Commission should be working with the California Independent System Operator (CAISO) to determine if the Resource Adequacy Availability Incentive Mechanism (a financial risk) can be replaced with another mechanism to alleviate one of the forms of risk listed by SCE in this Advice Letter. Doing so could reduce the need to retain capacity allowing all LSEs to meet their compliance obligations. Failing to do so means having MWs in an IOU

portfolio that are not subject to a CAISO must offer to ensure that they are available to serve market reliability needs.

## **2. SCE's Proposed Methodology to Retain RA Capacity Does Not Mitigate Unintended Consequences**

D.20-05-030 dismissed the WG3 proposal for addressing excess resources on the grounds that:

This proposal is not properly tailored to minimize the risks that the allocations would create market inefficiencies for RA, raise costs for bundled and unbundled customers alike, or create RA planning and compliance problems when layered with the new CPE and RA compliance requirements.<sup>6</sup>

While the Commission raised concerns with the WG3 proposal and identified unintended consequences, SCE's Advice Letter will have unintended consequences of its own. Any MW in excess of a requirement may well never be used for RA (either as substitution or to provide capacity to the CAISO via the Capacity Procurement Mechanism). This will result in a resource not being subject to the CAISO's must-offer obligations which includes bid insertion if an RA resource fails to offer their energy to the CAISO's markets. Such idle capacity could have been used by an LSE in need of RA and would have been subject to the CAISO's must offer obligation, ensuring that the energy associated with the capacity is available to reliably serve the market's needs.

## **3. The Constrained Capacity Market in California Coupled with Significantly Increased RA Penalties is Not a Market in Which Retaining Capacity Should be Allowed**

With three Commission orders to perform incremental procurement and a proceeding contemplating the acceleration of that procurement to earlier implementation<sup>7</sup>, the strain on availability of capacity is already well documented. During such a constrained capacity environment, the demand for capacity resources can be expected to be high. With RA penalties for the summer of \$8.88/kW-month and that amount doubling or tripling dependent on how many non-compliance events an LSE has had, it is difficult to understand why an LSE would be subject to such measures while capacity is retained by the IOUs.

---

<sup>6</sup> D.21-05-030 at 44.

<sup>7</sup> D.19-11-016 requires 3.3 gigawatts (GW) between the summer of 2021 – 2023, D.21-03-056 requires 1 GW for the summer of 2021, D.21-06-035 requires 11.5 GW between 2023 – 2026, and Rulemaking (R.) 20-11-003 is contemplating accelerating up to 5 GW of procurement from the latter years to the summer of 2022-2023.

## CONCLUSION

For the reasons set forth above, the Commission should require SCE to provide greater justification by demonstrating the risks based upon historical experience of those risks being realized and place more meaningful limits, including a firm monthly cap on the amount of capacity retention, so that all LSEs can meet their compliance obligations and the resources are made available through a CAISO must offer obligation.

CalCCA thanks the Energy Division for its review of this protest.

Respectfully,

CALIFORNIA COMMUNITY CHOICE  
ASSOCIATION

Evelyn Kahl
